#### Set Notation and Elements of a Set

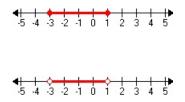

Schematically, *set notation* for a set S is written in the form

 $S = \{x \in category \mid test determining whether x is in the set \}.$ 

An object *x* is an *element* of a set *S* if it is contained in *S*, that is, if it passes the test written in the second half of the preceding notation. When this happens, we write  $x \in S$ .

Write the following in interval notation:

▲□ ▶ ▲ □ ▶ ▲ □ ▶

Write the following in interval notation:

同 とう モン うけい

### **Union and Intersection**

Suppose *A* and *B* are sets.

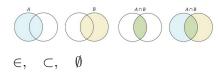

- (a) The *union* of *A* and *B* is the set  $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$ .
- **(b)** The *intersection* of *A* and *B* is the set  $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$ .

#### **Union and Intersection**

Suppose *A* and *B* are sets.

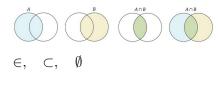

- (a) The *union* of *A* and *B* is the set  $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$ .
- **(b)** The *intersection* of *A* and *B* is the set  $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$ .

#### **Union and Intersection**

Suppose *A* and *B* are sets.

- (a) The *union* of *A* and *B* is the set  $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$ .
- **(b)** The *intersection* of *A* and *B* is the set  $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$ .

Rational and Irrational Numbers (a) A rational number is a real number that can be written as a quotient of the form  $\frac{p}{q}$  for some integers p and q, with  $q \neq 0$ .

(b) An irrational number is a real number that cannot be written in the form of a rational number.

#### **Functions**

A *function* f from a set A to a set B is an assignment f that associates to each element x of the *domain* set A exactly one element f(x) of the *codomain*, or *target*, set B.

イロト イヨト イヨト イヨト

#### **Functions**

A *function* f from a set A to a set B is an assignment f that associates to each element x of the *domain* set A exactly one element f(x) of the *codomain*, or *target*, set B.

#### **Domain and Range of a Function**

If *f* is a function between unspecified subsets of  $\mathbb{R}$ , then we will take the *domain* of *f* to be the largest subset of  $\mathbb{R}$  for which *f* is defined:

Domain $(f) = \{x \in \mathbb{R} \mid f(x) \text{ is defined }\}.$ 

The *range* of such a function is the set of all possible outputs that it can attain:

Range(f) = { $y \in \mathbb{R}$  | there is some  $x \in \text{Domain}(f)$  for which f(x) = y }.

イロト イヨト イヨト イヨト

#### **One-to-One Function**

A function *f* is *one-to-one* if, for all *a* and *b* in the domain of *f*,

$$a \neq b \implies f(a) \neq f(b).$$

Calculus with Functions MATH 231, Chapter 0

ヘロト ヘロト ヘヨト ヘヨト

Vocabulary	Definition	Behavior
f has a <b>root</b> at $x = c$	f(c) = 0	graph intersects the $x$ -axis at $x = c$
f has a <b>y-intercept</b> at $y = b$	f(0) = b	graph intersects the $y$ -axis at $y = b$
f is <b>positive</b> on I	$f(x) > 0$ for all $x \in I$	graph is above the $x$ -axis on $I$
f is <b>increasing</b> on I	f(b) > f(a) for all $b > a$ in $I$	graph moves up as we look from left to right on <i>I</i>
f has a <b>local</b> <b>maximum</b> at $x = c$	$f(c) \ge f(x)$ for all x near $x = c$	graph has a relative "hilltop" at $x = c$
f has a <b>global</b> <b>maximum</b> at $x = c$	$f(c) \ge f(x)$ for all $x \in \text{Domain}(f)$	graph is the highest at $x = c$
f is <b>concave up</b> on I	will state precisely in Section 3.3	graph curves upwards on <i>I</i> like part of a "U"
<i>f</i> has an <i>inflection point</i> at <i>x</i> = <i>c</i>	will state precisely in Section 3.3	graph of $f$ changes concavity at $x = c$

# Algebraic functions

Туре	General Form	Examples
Linear	f(x) = mx + b, where <i>m</i> and <i>b</i> are any real numbers	$f(x) = 2x - 1, \ f(x) = 1.4x$
Power	$f(x) = Ax^k$ , where $A \neq 0$ is real and k is rational	$f(x) = 3x^3, \ f(x) = 1.7x^{-1/5}$
Polynomial	$f(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x + a_0$ , where <i>n</i> is a nonnegative integer and each $a_i$ is a real number	$f(x) = 3x^5 - 2x^3 + x - 6$
Rational	$f(x) = \frac{p(x)}{q(x)}$ , where $p(x)$ and $q(x)$ are polynomials	$f(x) = \frac{3x^2 - 1}{x^5 + x^3 + 1}$
Other	any other algebraic function that is not one of the types listed	$f(x) = \frac{1 + \sqrt{x}}{1 + x}, \ f(x) = x^{2/3} + 5$

If f and g are functions such that

g(f(x)) = x, for all x in the domain of ff(g(x)) = x, for all x in the domain of g

then *g* is the *inverse* of *f* and we denote *g* by  $f^{-1}$ .
