
Problem of the Week

Solution One

Two dogs were standing in a field facing in opposite directions. One was facing due north and the other was facing due south. It turns out, though, that the dogs were able to see each other without employing any mirrors or reflecting surfaces. How is this possible?

SOLUTION: The two dogs were facing each other the whole time, of course. One dog was facing south, and the first thing he saw was the north-facing dog. Likewise, the first thing seen by the dog facing north was the south-facing dog.
