

- Let $-$ be the usual subtraction on the set $\mathbb{Z} = \{\dots, -2, -1, 0, 1, 2, \dots\}$ of integers. Does $-$ have an identity?
- Determine whether the following binary operations $*$ on $S = \{0, 1\}$ have an identity. For those that do, determine whether or not each element has an inverse.

(a)

$*$	0	1
0	1	0
1	0	1

(b)

$*$	0	1
0	1	0
1	1	1

(c)

$*$	0	1
0	0	1
1	1	1

- Below is a table for a binary operation \circ on the set $S = \{a, b, c, d, f, g, h\}$.

\circ	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>f</i>	<i>g</i>	<i>h</i>
<i>a</i>	<i>g</i>	<i>a</i>	<i>h</i>	<i>b</i>	<i>d</i>	<i>c</i>	<i>f</i>
<i>b</i>	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>f</i>	<i>g</i>	<i>h</i>
<i>c</i>	<i>h</i>	<i>c</i>	<i>d</i>	<i>g</i>	<i>a</i>	<i>f</i>	<i>b</i>
<i>d</i>	<i>b</i>	<i>d</i>	<i>g</i>	<i>f</i>	<i>h</i>	<i>a</i>	<i>c</i>
<i>f</i>	<i>d</i>	<i>f</i>	<i>a</i>	<i>h</i>	<i>c</i>	<i>b</i>	<i>g</i>
<i>g</i>	<i>c</i>	<i>g</i>	<i>f</i>	<i>a</i>	<i>b</i>	<i>h</i>	<i>d</i>
<i>h</i>	<i>f</i>	<i>h</i>	<i>b</i>	<i>c</i>	<i>g</i>	<i>d</i>	<i>a</i>

- What is the identity for \circ ?
- Pair each element of S with its inverse.
- Write a table for \circ using only the elements $\{b, d, h\}$.

4. $D_6 = \{I, S, S^2, S^3, S^4, S^5, R_1, R_2, R_3, R_4, R_5, R_6\}$ is the symmetry group of the regular hexagon. Recall each R_i is a reflection and $S = R_1R_2$ is the minimal counterclockwise rotation. Since D_6 is a group, its binary operation is associative, it has an identity, and every element has an inverse. Pair each element of D_6 with its inverse.
5. Look at the following table.

$*$	a	b	c	d	f
a	c	d	a	f	b
b	f	c	b	a	d
c	a	b	c	d	f
d	b	f	d	c	a
f	d	a	f	b	c

- (a) Find the identity.
- (b) Pair every element with its inverse.
- (c) If this is *not* the table for a group, then what can you tell me about $*$?
6. Let G be a group under $*$ (so, in particular, every element of G has an inverse). If G has an even number of elements, prove there must be at least one element, other than the identity e , that is its own inverse.

1. No. The only possibility would be 0. While it is true that for any $n \in \mathbb{Z}$, $n - 0 = n$, 0 is *not* an identity because $0 - n = -n$. (So, for example, $0 - 7 = -7 \neq 7$.)

2a. 1 is the identity, so it is its own inverse. 0 is also its own inverse.

2b. There is no identity, and therefore no inverses.

2c. 0 is the identity, so it is its own inverse. 1 has no inverse.

3a. The identity is b .

3b. $b \leftrightarrow b, a \leftrightarrow d, c \leftrightarrow h, f \leftrightarrow g$.

3c.

\circ	b	d	h
b	b	d	h
d	d	f	c
h	h	c	a

Notice you need elements other than $b, d,$ and h to fill in this table.

4. Since every reflection is its own inverse, $R_i \leftrightarrow R_i$ for each i . As always, $I \leftrightarrow I$. For the nontrivial rotations, $S \leftrightarrow S^5, S^2 \leftrightarrow S^4,$ and $S^3 \leftrightarrow S^3$. (Notice the sum of the exponents is always 6.)

5a. The identity is c .

5b. Every element is its own inverse.

5c. $*$ cannot be associative, because if it *were* associative, then this *would* be a group.

In fact, $*$ is not associative, so this is not a group. For example, $(f * b) * d = a * d = f$, while $f * (b * d) = f * a = d$.

6. Since there are an *odd* number of elements in G other than the identity (which is its own inverse) and elements come in inverse pairs, something *else* must be paired with itself. That element is its own inverse.
